

According to ISO 14025:2006 and ISO 21930:2017

A Regionalized Industry Average EPD for Concrete Pipe

ASTM International Certified Environmental Product Declaration

This is a Canadian regionalized industry average business-to-business Type III environmental product declaration for concrete pipe as produced by CCPPA members. This declaration has been prepared in accordance with ISO 14025:2006 and ISO 21930:2017, the governing precast concrete category rules and ASTM international's EPD program operator rules.

The intent of this document is to further the development of environmentally compatible and more sustainable construction products by providing comprehensive environmental information related to potential impacts of concrete pipe available in various parts of Canada in accordance with international standards.

Environmental Product Declaration Summary

EPD Owner					
CCPPA Build on our strength	Canadian Concrete Pipe and Precast Association 447 Frederick St #2 Kitchener, ON N2H 2P4 Link (URL): www.ccppa.ca				
Product Group and Name	Concrete Pipe (UN CPC 3755)				
Product Definition	Depending on the application, concrete pipe may or may not be conventionally reinforced. Precast concrete pipe is used in conveying wastewater and stormwater through complex underground infrastructure systems, preserving groundwater quality and ensuring a sanitary environment. Reinforced concrete pipe is available in a variety of sizes and strength classes to meet any need.				
Product Category Rules	NSF PCR for Precast Concrete, V3.0, May 2021. [5].				
Certification Period	31.03.2023 - 31.03.2028				
Declared Unit	1 metric tonne (1,000 kg) of concrete pipe				
ASTM Declaration Number	EPD # 436				

EPD Program Operator	ASTM International				
Declaration Holder	Canadian Concrete Pipe and Precast Assocation				
Declaration Type	<u> </u>				
CCPPA members. Activity stages or information	EPD for concrete pipe as a product group manufactured by modules covered include production with the product ready ules A1 to A3). The declaration is intended for use in				
Product Applicability					
Concrete pipe products satisfy a wide array of wa	astewater and stormwater infrastructure applications.				
Content of the Declaration This declaration follows: Concrete, V3.0, May 2021 [5]	ows Section 9; Content of an EPD, NSF PCR for Precast				
This EPD was independently verified	Timothy Brooke				
by ASTM in accordance with ISO 14025:	ASTM International 100 Barr Harbor Dr.				
Internal External	West Conshohocken, PA 19428				
X	tbrooke@astm.org				
EPD Project Report Information					
EPD Project Report	A Regionalized Industry-Average Cradle-to-Gate LCA of Precast Concrete Products Produced by CCPPA Members, December 2022				
Prepared by					
Athena Sustainable Materials Institute	Athena Sustainable Materials Institute 119 Ross Avenue, Suite 100 Ottawa, Ontario, Canada K1Y 0N6 info@athenasmi.org				
This EPD project report was independently verified by in accordance with ISO 14025 and the reference PCR:	Thomas P. Gloria, Ph. D. Industrial Ecology Consultants 35 Bracebridge Rd. Newton, MA 02459-1728				
This EPD was prepared using Athena Institute's pre-verified EPD Concrete Tool v2 (February 2022)					
PCR Information					
Program Operator	NSF and ASTM International				
Reference PCR	NSF PCR for Precast Concrete, V3.0, May 2021[5]				
PCR review was conducted by:	Dr. Thomas Gloria, Industrial Ecology Consultants Mr. Bill Stough, Bill Stough, LCC Dr. Michael Overcash, Environmental Clarity

1 PRODUCT IDENTIFICATION

1.1 PRODUCT DEFINITION

Precast concrete (UN CPC 3755) is a construction product produced by casting concrete in a reusable mold or "form" which is then cured in a controlled environment, transported to the construction site, and lifted into place. In contrast, standard concrete is placed into site-specific forms and cured on site. Precast concrete is primarily composed of portland cement, aggregates, and steel reinforcement materials. The applicable Canadian product standard for precast concrete products is CSA 23.4 Precast Concrete – Materials and Construction

For the purposes of this EPD the following broad descriptive definition for concrete pipe is as follows [5]:

Concrete pipe: Depending on the application, concrete pipe may or may not be conventionally reinforced. Precast concrete pipe is used in conveying wastewater and stormwater through complex underground infrastructure systems, preserving groundwater quality and ensuring a sanitary environment. Reinforced concrete pipe is available in a variety of sizes and strength classes to meet any need.

This EPD represents a baseline for the production of concrete pipe and exemplifies an average product group as an average from more than one manufacturer. Further, this EPD reports regional results as follows: *Western Canada* (BC, AB, SK and MN) and *Ontario Canada* (ON).

2 PRODUCT APPLICATION

Concrete pipe products are engineered products satisfying a wide array of waste water and storm water conveyance applications.

3 DECLARED UNIT

The declared unit is 1 metric tonne of concrete pipe.

4 MATERIAL CONTENT

Table 1 presents the regional weighted average material content by input material for the concrete pipe product group as derived from participating member facilities LCI data for the reference year 2021.

Table 1: Material Content for Concrete Pipe Product Groups

Inputs	Ontario Region Ingredients (kg/tonne)	Western Region Ingredients (kg/tonne)
Cement		
Portland Cement	87.8	121.2
Aggregate		
Crushed Coarse Aggregate	242.7	303.0
Crushed Fine Aggregate	304.6	494.9
Natural Fine Aggregate	154.4	0.0
Natural Coarse Aggregate	101.2	0.0
SCMs		
Slag Cement	44.5	0.0
Fly Ash	15.6	36.3
Other Materials		
Cold Drawn Wire Reinforcement	61.0	45.0
Reinforcing bar	0.0	0.0
Steel Anchors	0.0	0.0
Welded Wire Reinforcement	0.0	0.0
Admixtures/form release agents (L)	0.46	0.35
Batch water (L)	53.7	58.2

5 PRODUCTION STAGE

Figure 1 shows the production stage system boundary for the declared product system.

PROD	UCTION S	STAGE	CONSTR STA	RUCTION AGE			ı	JSE STAC	iΕ			E	ND OF L	IFE STAG	iΕ
Extraction and upstream production	Transport to Factory	Manufacturing	Transport to site	Installation	Use	Maintenance	Repair	Replacement	Refurbishment	Operational energy use	Operational water use	Deconstruction / Demolition	Transport	Waste Processing	Disposal of Waste
A1	A2	A3	A4	A5	B1	B2	В3	B4	B5	B6	B7	C1	C2	СЗ	C4
Х	х	х	MND	MND	MND	MND	MND	MND	MND	MND	MND	MND	MND	MND	MND

Figure 1 Production stage system boundary

The Production Stage includes the following processes [5]:

- ➤ A1 Extraction and processing of raw materials, including fuels used in product production and transport within the manufacturing process (A3);
- A2 Average or specific transportation of raw materials from the extraction site or source to manufacturing site, inclusive of empty backhauls (where applicable);
- ➤ A3 Manufacturing of each precast product including all energy and materials required and all emissions and wastes produced;
- Average or specific transportation from manufacturing site to recycling/reuse/landfill for pre-consumer wastes and unutilized by-products from manufacturing, including empty backhauls (where applicable); and
- Final disposition of pre-consumer wastes inclusive of transportation.

The Production Stage excludes the following processes [5]:

- Production, manufacture, and construction of manufacturing capital goods and infrastructure;
- > Formwork;
- Production and manufacture of production equipment, delivery vehicles, and laboratory equipment;
- Personnel related activities (travel, office operations and supplies); and
- Energy and water use related to company management and sales activities that may be located either within the factory site or at another location.

6 LIFE CYCLE INVENTORY

6.1 DATA COLLECTION AND REPRESENTATIVENESS

Life cycle inventory data were collected from 18 facilities within Canada for the 2021 reference year – representing more than 75% of CCPPA's membership. In total the participating facilities produced in the order of 1 million metric tonnes of precast products.

All gate-to-gate LCI flow data for energy, total water use, emissions and waste generated were averaged on the annual production basis across facilities to determine an overall per unit precast plant operations profile. These per unit gate-to-gate operational flows were used to estimate the plant production effects across all precast product groups as plants were unable to provide detailed process breakdowns for each product type but provided annual product group production figures. Each plant also provided averaged formulation data for each product group they produce, and these data too were also averaged on a production weighted basis, but only across plants producing the precast product of interest; in this case concrete pipe. Hardware (lifting or connections) was included. These product formulations were also reviewed by CCPPA's technical marketing group for plausibility (e.g., water to cement ratio, etc.)

6.2 SECONDARY LCI DATA SOURCES A1-A3

Flow Ref.	Materials	LCI Data Source	Year / Region	Data Quality Assessment
A1-1	GU and GUL Cement ASTM C150, C595, C1157	Calculated based on EPD data for specific suppliers	2021-2022 Canada	 Technology: very good Time: very good Geography: very good Completeness: very good Reliability: very good

6.3 CUT OFF RULES, ALLOCATION RULES AND DATA QUALITY REQUIREMENTS

Cut-off rules, as specified in NSF PCR for precast concrete: 2021, Section 7.1.8 were applied [5]. All input/output flow data reported by the participating member facilities were included in the LCI modeling. None of the reported flow data were excluded based on the cut-off criteria. No substances with hazardous and toxic properties that pose a concern for human health and/or the environment were identified in the framework of this EPD.

Allocation procedures observed the requirements and guidance of ISO 14044:2006, clause 4.3 and those specified in NSF PCR for precast concrete, section 7.1. The majority of the precast facility operations were dedicated to the production of one or more precast product groups. A small number of the facilities also produced other specialty precast products – a co-product - and in such instances "mass" allocation was used to allocate facility LCI environmental flows

(inputs and outputs) across the co-products for those facilities prior to calculating and rolling up the weighted average LCI flows for the gate-to-gate process and individual product groups.

In addition, the following allocation rules are applied:

- Allocation related to transport is based on the mass and distance of transported inputs;
- The NSF sub-category PCR recognizes fly ash, silica fume and granulated bast furnace slag as recovered materials and thus the environmental impacts allocated to these materials are limited to the treatment and transportation required to use as a precast concrete material input. That is, any allocations before reprocessing are allocated to the original product;
- The environmental flows related to the disposal of the manufacturing (pre-consumer) solid and liquid waste are allocated to module A3 Manufacturing.

Data quality requirements, as specified in NSF's Precast Concrete PCR: 2021, section 7.1.9, were observed [5]. This section also describes the achieved data quality relative to the ISO 14044:2006 requirements. Data quality is judged on the basis of its precision (measured, calculated or estimated), completeness (e.g., unreported emissions), consistency (degree of uniformity of the methodology applied within a study serving as a data source) and representativeness (geographical, temporal, and technological).

Precision: The Canadian participating member companies through measurement and calculation collected primary data on their production of precast concrete and the various sub-group product categories. For accuracy the LCA team individually validated these plant gate-to-gate input and output data.

Completeness: All relevant, specific processes, including inputs (raw materials, energy and ancillary materials) and outputs (emissions and production volume) were considered and modeled to represent industry average precast concrete. The relevant background materials and processes were taken from the US LCI Database, ecoinvent v 3.4 LCI database for Canada, United States and/or global and modeled in Athena's pre-verified Concrete LCA Software v2 (February 2022).

Consistency: To ensure consistency, the LCI modeling of the production weighted input and output LCI data for each regional precast product used the same modeling structure across the member facilities producing these products, which consisted of input raw and ancillary material, energy flows, water resource inputs, product and co-products outputs, emissions to air, water and soil, and material recycling and pre-consumer solid and liquid waste treatment. Crosschecks concerning the plausibility of mass and energy flows were continuously conducted. The LCA team conducted mass and energy balances at the plant and selected process level to maintain a high level of consistency.

Reproducibility: Internal reproducibility is possible since the data and the models are stored and available in CCPPA Precast Athena LCI database developed in Athena's pre-verified Concrete LCA Software v2. A high level of transparency is provided throughout the LCA background report (publicly available) as the weighted average LCI profile for each product sub-group is presented for the declared product. Key primary (manufacturer specific) and secondary (generic) LCI data sources are also summarized in the LCA background report. The provision of more detailed data to allow full external reproducibility was not possible due to reasons of confidentiality.

Representativeness: The representativeness of the data is summarized as follows.

- *Time related coverage* of the precast manufacturing process primary data collected: 2021 (12 months).
- Generic data: the most appropriate LCI datasets were used as found in the US LCI (adjusted) Database, ecoinvent v.3.4 database for United States, Canada and global.
- Sector specific data: each regional concrete pipe profile is based on plant specific cement production EPDs as used at each regional precast plant.
- Geographical coverage: the geographical coverage is Canada (various regions).
- Technological coverage: typical or average.

7 LIFE CYCLE ASSESSMENT

7.1 RESULTS OF THE LIFE CYCLE ASSESSMENT

This section summarizes the results of the life cycle impact assessment (LCIA) based on the cradle-to-gate life cycle inventory inputs and outputs analysis. The regional results are calculated on the basis of one metric tonne (1,000 kg) of concrete pipe (Tables 2-4). The concrete pipe production results are delineated by information module (A1 – Raw material supply), (A2 – Raw material transport), and (A3 – precast core manufacturing). Tables 4 and 5 represent the minimum and maximum values for concrete pipe.

As per NSF PCR for precast concrete:2021, Section 7.3, the US EPA Tool for the Reduction and Assessment of Chemical and Other Environmental Impacts (TRACI), version 2.1, 2012 impact categories are used as they provide a North American context for the mandatory category indicators to be included in this EPD. These are relative expressions only and do not predict category impact end-points, the exceeding of thresholds, safety margins or risks. Total primary and sub-set energy consumption was compiled using a cumulative energy demand model. Material resource consumption and generated waste reflect cumulative life cycle inventory flow information. In addition, some LCA impact categories and inventory items are still under development and can have high levels of uncertainty and demarked with an "*". To promote uniform guidance on the data collection, calculation and reporting of results, the ACLCA methodology guidance (ACLCA 2019) was used [6].

7.2 INTERPRETATION

Across the three production information modules, module A1- raw material supply contributes the largest share of the impact category results. The upstream raw material supply (A1) also accounts for a large share of energy use; almost all of which is drawn from non-renewable energy sources. Raw material transportation (A2) proves to be a minor contributor to the burdens exhibited by concrete pipe products – generally 10% or less. Manufacturing (A3) concrete pipe products contributes in the order of 10% of all greenhouse gases and about 20% to 25% of the primary energy use.

8 ADDITIONAL ENVIRONMENTAL INFORMATION

Quality and Environmental Management Systems

In general, CCPPA member manufacturing facilities follow the ISO 14001 environmental management system, ISO 9001 quality management system or other in-house quality control systems.

9 DECLARATION TYPE AND PRODUCT AVERAGE DECLARATION

The type of EPD is defined as:

A "Cradle-to-gate" EPD of concrete pipe products covering the product stage (modules A1 to A3) and is intended for use in Business-to-Business communication.

This EPD for concrete pipe, UN CPC 3755 is an average product EPD, as an average from several CCPPA member facilities in various regions of the country.

10 DECLARATION COMPARABILITY LIMITATION STATEMENT

The following ISO statement indicates the EPD comparability limitations and intent to avoid any market distortions or misinterpretation of EPDs based on the NSF's Precast Concrete PCR: 2021:

- EPDs from different programs (using different PCR) may not be comparable.
- Declarations based on the NSF Precast Concrete PCR [5] are not comparative assertions; that is, no claim of environmental superiority may be inferred or implied.

11 EPD EXPLANATORY MATERIAL

For any explanatory material, in regard to this EPD, please contact the program operator.
